Hair Transplantation Methods Comparing Table

3 months donor area recovery	3 months donor area recovery	3 months donor area recovery
1 year total recovery	1 year total recovery	1 year total recovery
95% success rate (the graft stands)	60% success rate	85% success rate
shaving	no shaving	shaving
sedation	sedation	sedation
fast recovery	recovery	fast recovery
5500 grafts max	4000 grafts max	5500 grafts max
8-10 hours operation	6-7 hours operation	6-7 hours operation
2 nights 3 days in Istanbul	2 nights 3 days in Istanbul	2 nights 3 days in Istanbul
open the root	no need to open root	open the root
no pain during operation	no pain during operation	no pain during operation
In 3th day hair can be washed	In 3th day hair can be washed	In 3th day hair can be washed

Organic Hair Transplant

ESem cell-rich liquid prepared from **patient's own fat tissue** is injected to the transplantation area. This way, application site is swelled to enable a convenient transplantation area and chemical injections that damage the follicles in conventional **hair transplantation procedure** are avoided.

Healthy hair follicles collected from the donor site are transferred to the hairless area, which prepared and made productive for the application, by our surgeon.

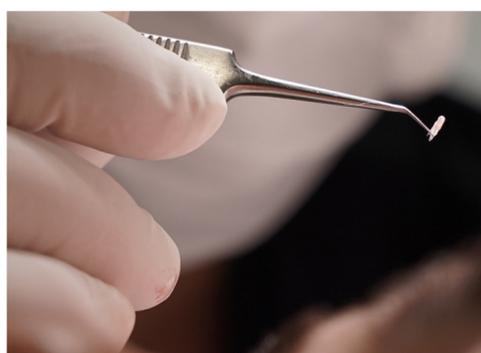

Direct Hair Implantation (DHI)

is an advanced and innovative hair restoration treatment that uses a **Choi implanter** pen to treat hair loss in men and women. It is based on the graft extraction-transplantation technique, similar to Follicular Unit Extraction, where hair follicles are harvested from a donor area and implanted into the recipient area experiencing balding. **DHI offers a painless and efficient solution for hair restoration**, with a shorter recovery time compared to traditional hair transplant procedures. The DHI technique is considered a breakthrough in hair transplant procedures because it can achieve highly natural-looking results. The use of the Choi pen allows for denser hair implantation with minimal impact on the skin's integrity, and the procedure **can be performed without completely shaving the head**. The clinic also provides a comparison between FUE and DHI to guide patients in choosing the **best hair surgery option for their needs**.

Sapphire FUE Hair Transplant

The FUE method is a commonly used hair transplant technique that has recently advanced through the use of sapphire blades, which can provide natural-looking results. Patients at Estetik International can also choose to enhance the procedure with soft sedation.

Frequently Asked Question

What happens after the surgery?

It is important to follow the post-operative instructions provided by your surgeon to ensure optimal healing and hair growth. This may include avoiding certain activities or products, taking prescribed medications, and attending follow-up appointments. Patients may experience some temporary side effects such as swelling, scabbing, itching, and numbness, which typically resolve within a few weeks to a few months. Follow-up visits are important for monitoring progress and assessing the results of the procedure.

Are there any complications from surgery?

Some potential complications of hair transplant surgery may include bleeding, infection, scarring, poor hair growth or unnatural-looking results, swelling, itching, numbness, and shock loss.

Does the procedure hurt?

To clarify further, local anesthesia is used to numb the area where hair follicles are extracted and transplanted, so you won't feel any pain during the surgery. Intravenous sedation may also be used to help you relax and feel more comfortable during the procedure.

Will my transplanted hair eventually fall out?

Yes, the transplanted hair is generally permanent and is not expected to fall out. The transplanted hair follicles are taken from areas of the scalp that are genetically resistant to balding and are therefore unlikely to fall out in the future.

Will I be able to swim and enjoy other physical activities with my new hair?

Yes, you should be able to swim and participate in physical activities with your new hair after a short recovery period like 1 month. The transplanted hair is permanent and can be washed, cut, and dyed like your natural hair.
